

# Burndown Chart

## Comments about the burndown chart:

The reason for the increase in story points on the date of July 1<sup>st</sup> 2023 is because that is the day we assigned story point estimates to the stories. For a total of 38 story points. Therefore, our planned sprint velocity for this sprint was 38 story points. But we only managed to complete 34 story points worth of stories, thus our sprint velocity for this sprint is 34 story points. The reason that this burndown chart does not have a guideline is because the sprint had been started with none of the stories having story points, which were instead added later on July 1<sup>st</sup> as I mentioned above.

## Compare the planned velocity with the previous sprint velocity:

We could not edit the story points for the stories of the previous sprint, Sprint 1, on Jira, so instead we simply discussed and noted it down. The story points for those stories are:

C01-3 - 5 story points

C01-4 & C01-5 - 8 story points

C01-8 - 3 story points

C01-7 & C01-21 - 8 story points

C01-10 & C01-9 - 8 story points

C01-32 - 3 story points

C01-12 - 5 story points

C01-13 - 5 story points

For a total of 45 story points. Therefore we had a planned sprint velocity of 45 story points. Of these stories, all of them except C01-7 & C01-21 were completed, thus our sprint velocity for the previous sprint was 37 story points.

Our planned velocity for this sprint (38) is higher than the sprint velocity of the previous sprint (37), but less than the planned velocity for the previous sprint (45). This change is because we realized during the previous sprint review that we had made the stories too large for individual team members and so when planning we made the stories for this sprint more fine-grained and manageable, while also ensuring we didn't take too many, thus ending up with a smaller commitment of story points.
